U.S. Patent and Trademark Office PTOL-303 (Rev. 08-06) With respect to claims 2,3,5,7 and 8, the scope of the claims has been changed and would require further search and/or consideration. With respect to claim 1, applicant states that Graves fails to disclose "stopping the transmission of an optical signal in a condition that none of the levels detected from another received optical signal exceeds a predetermined value." However, because the system of Graves teaches intermittent transmission between transmitters and receivers such that when one transceiver is transmitting the other transceiver is only receiving and vice versa, this means that transmission of an optical signal from a given transceiver is stopped until the light received at the given transceiver exceeds a predetermined value, in this case a value of zero. Because of the broadness of the added limitation of claim 1, most intermittent transceivers would be able to be read upon this limitation simply given the fact that in such a system the transmitter of a given transceiver cannot transmit until the receiver of said transmitter has received an optical signal with a value greater than zero.
